## Configure your Windows IoT Core device

- To be able to deploy applications from Visual Studio 2015, you will need to make sure the Visual Studio Remote Debugger is running on your Windows IoT Core device. The remote debugger should launch automatically at machine boot time. To double check, use the `tlist` command to list all the running processes from powershell. There should be two instances of `msvmon.exe` running on the device.
- It is possible for the Visual Studio Remote Debugger to time out after long periods of inactivity. If Visual Studio cannot connect to your Windows IoT Core device, try rebooting the device.
- If you want, you can also rename your device. To change the 'computer name', use the `setcomputename` utility:

```
[192.168.0.243]: PS C:\> setcomputename <new-name>
```

You will need to reboot the device for the change to take effect. You can use the `shutdown` command as follows:

```
[192.168.0.243]: PS C:\> shutdown /r /t 0
```
